

Installation & Deployment

The implementation of the environment was completed by executing the official NVIDIA one-command installer script, which automatically handles the deployment of the nemoclaw control interface and provisions the host-side prerequisites (including Node.js 22 and essential Docker daemon validation hooks). Following the baseline platform setup, the guided onboarding wizard was initiated using the nemoclaw onboard command to configure the runtime blueprint, bind the necessary model inference providers, and initialize the secure OpenShell sandbox boundary wrapper.

Note: For this deployment process, I referenced the official step-by-step documentation from the NVIDIA NemoClaw Quickstart Guide (available at <https://docs.nvidia.com/nemoclaw/latest/get-started/quickstart>).
